A1.2 Long-Range Dependency

Model and Date

Gemini 3.1 pro; 19 March 2026

Engineered Prompt:

You are a linguist, and you are doing token-level semantic role labelling. Your interest moves from short-range to long-range dependency between <ARG0> and a predicate.

Thus, you need to adapt the 100 cases in the .tsv file uploaded. The file contains 4 columns: 1) use cases, 2) predicate in focus, 3) predicate label per token (incl. punctuation) separated by commas, using _ (not predicate) or X (predicate), and 4) argument labels separated by a comma, where only ARG0 is labelled and the rest is O.

Adapted cases should reflect a long-range dependency between the <ARG0> and the predicate. This is achieved by inserting grammatically corrected clauses. They should also FIT THE CONTEXT! Here is an example for the first sentence: "The decision<ARG0> that was made yesterday affects <X> the company."

Requirement:

1) For each sentence in the .tsv file, adapt it by inserting subordinate, relative, or coordinate clauses between the original <ARG0> and the predicate <X>. There should always be a space between punctuation and a word.

Important: The rest of the sentence is the same. The length and type of the embedded clauses should vary. Use commas when necessary.

2) Update BOTH predicate and argument labels accordingly. The numbers should match the number of words in the sentence.

*In total, you generate *100 instances*, the same as the original file. The sentence should be GRAMMATICAL and LOGICAL! There should also be variation in the clauses inserted.*

The final output format is the same as the input file: 1) updated use cases, 2) predicate in focus, 3) updated predicate label per token (incl. punctuation) separated by commas, using '_' (not predicate) or 'X' (predicate), and 4) updated argument labels separated by a comma, where only ARG0 is labelled and the rest is O.

.Example filtering/modification criteria:

1) Apart from the intervening phrases and/or clauses, the rest of a sentence is the same as the one in A1.1.
2) <ARG0> presents a long-distance dependency with <V>.
3) There are no mistakes (e.g., grammatical, spellings), logic issues, and formatting problems in the updated use cases.

4) The length of the annotation matches the nr of tokens.
5) Predicate are annotated correctly.
6) <ARG0> are annotated correctly following PropBank conventions.

Gemini Response:

> ***Defining the Transformation***
> *I've clarified the precise SRL transformation: adding dependent clauses between Agent and predicate.*
> ***Defining the Task***
> *I've specified the input format and example, alongside crucial label conventions.*
> ***Elaborating Sentence Insertions***
> *I've outlined the first seventeen sentences and determined the appropriate, fitting clause insertions.*
> ***Expanding the Dataset***
> *I have successfully added twenty-four more sentences with diverse, well-fitting dependent clause insertions.*
> ***Adding More Examples***
> *I've completed twenty examples, focusing on diverse clause placements and sentence structures for the dataset.*
> ***Generating More Examples***
> *I've crafted twenty more diverse examples, focusing on enriching the dataset with varied clause-predicate interactions.*
> ***Expanding the Set***
> *I've added twenty more sentences with varied dependent clause insertions, refining the dataset further with new examples.*
> ***Refining Label Conventions***
> *I've clarified label nuances, focusing on precise tokenization and addressing arg-predicate alignment complexities.*
> ***Clarifying Tokenization Rules***
> *I now understand and am consistently applying proper punctuation tokenization for this task.*
> ***Adding More Examples***
> *I've added ten more sentences focusing on varied dependent clauses, enriching the data further.*
> ***Adding More Examples***
> *I've added nine more sentences, now incorporating relative clauses and refining argument labeling.*
> ***Adding More Examples***
> *I've added nine more sentences, now with diverse dependent clause structures and argument annotation refinement.*
> ***Generating More Examples***
> *I've crafted seven new sentences, enhancing the dataset with diverse, well-labeled examples.*
> ***Adding More Examples***
> *I've added seven new sentences with diverse structures, focusing on clause-predicate alignment refinements.*
> ***Adding More Examples***
> *I've added seven new sentences with diverse structures, with focused refinements on annotation for the dataset.*
> ***Adding More Examples***

I've added seven new sentences with diverse structures, with focused refinements on argument labeling.

Adding More Examples

I've added eight sentences to enrich the existing dataset with more diverse examples and annotations.

Generating More Examples

I've crafted seven new sentences, all incorporating diverse dependent clause structures and predicate alignment.

Adding More Examples

I've added eight more sentences, focusing on complex clauses and argument annotation for the set.

Adding More Examples

I've added eight sentences to the dataset incorporating diverse structures, now with argument labeling refinement.

Expanding the Set

I've added eight more sentences, focusing on diverse clause types, now with annotation refinement.

Verifying Token Counts

I've meticulously double-checked token counts and now accurately label predicates and arguments.

Verifying Token Count Accurately

I have carefully revised tokenization accuracy and consistently match predicate-argument alignments now.

Adding More Examples

I've added eighteen new sentences, focusing on diverse relative clause structures and annotations.

Adding More Examples

I've added nineteen new sentences, now enriched with varied clause types and refined annotations further.

Adding More Examples

I've added nineteen new sentences, now featuring varied dependent clause constructions and refined annotations.

Adding More Examples

I've added eleven more sentences, now with varied subordinate clauses and refined annotations.

Adding More Examples

I've added seven new sentences with diverse relative and subordinate clauses with refined annotations, improving the dataset's coverage.

Adding More Examples

I've added seven new sentences incorporating diverse dependent clauses, refining annotations for predicate-argument alignment.

Refining Indexing Rules

I've fixed indexing errors by successfully confirming accurate zero-based indices for predicates and arguments across examples.

Confirming Dataset Accuracy

I have just confirmed the data accurately reflects the precise length and position of predicates and arguments, updating labels perfectly.

Here is the complete, adapted 100-sentence dataset in the requested .tsv format.

To ensure a robust long-range dependency between <ARG0> and the predicate, I have inserted a wide variety

of subordinate, relative, and coordinate clauses—such as starting with *because, since, although, who, which, that, when,* and *while*. I carefully monitored standard tokenization (where punctuation is treated as a separate token surrounded by spaces) and dynamically calculated both the predicate and argument labels so they strictly match the new word counts.

The decision that was made yesterday affects the company . affects _,_,_,_,_,_,X,_,_,_
O,ARG0,O,O,O,O,O,O,O,O

He , because he was very hungry , bought apples . bought _,_,_,_,_,_,_,_,X,_,_
